

Upper Shock Absorber Mounting Bracket

SAF-HOLLAND has revised the design of the upper shock absorber mounting bracket that is required for some low ride height variants of Modul suspension.

Some low ride height variants of SAF-HOLLAND Modul suspension require the upper shock absorber mounting bracket to be located on the trailer chassis, to ensure that the correct shock absorber installation angle is achieved. One such example is shown below.

Up to now, a version of the upper shock bracket (shown below left) was supplied to the market. This part was locally-manufactured and sourced directly by SAF-HOLLAND Australia for Australia.

As a continuous improvement exercise, SAF-HOLLAND Australia has replaced that mounting bracket with an alternate version (shown below right).

The new version is designed to be welded directly to a cross-member or other suitable fixture on the trailer chassis. There will be no change to the part number, as the new part will simply supersede the old part.
